

Low-dimensional representation and economic identification

Architecture-matched representation control

Training adds concentration beyond random initialization. Absolute rank decline also reflects narrowing layer width.

Later controls are exploratory; historical evaluation is not an untouched research-wide holdout.

IDENTIFICATION

Dimension rankings depend on the evaluation geometry.

Matched feature removal does not reproduce the archived rank reversal.

PRICING FUNCTION

Adding hidden-state rank: 3.915% HJ-loss RMSE gain

Below the specified 5% threshold; permutation $p = 0.149$.

INTERPRETATION

Concentration alone does not identify an invariant pricing dimension.
